

Completed Goals:

- Add Rejoin
- Replay Database Design
- Update UML
- Replay Feature with Speed Settings
- Display Life → get rid of last heart
- Java Doc
- JUnit Testing
- Make Prettier

Meeting 10: 4Hrs: both team members were present. Today we worked more with the database and how to add objects to the database. We ran into some issues with sqlite and had to work through our difficulties.

Meeting 11: 6Hrs: both team members were present. We have been working to implement the database however we have only been able to write to the database and have not been able to read from it. We wrote all the necessary steps but something small must be wrong or we must be missing something. We spent some time trying to figure out what was wrong/missing but could not seem to find anything that made a difference. In order to continue with the project we had to come up with a solution. We worked on a solution by creating a database for replay. We finished up the design by cleaning up our UI and making the design of the project prettier.

Overall we worked very well together and I think this project went over relatively flawlessly. Besides the issues we ran into with the database this project was very well done. We made sure to have no god classes, and no coupling. Our project is laid out very well and is implemented clearly. Overall it was a great project.
